

Q1HW #2Efe Eren Ceylan  
21303359Prove:  $\mathcal{H}\left\{\text{rect}\left(\frac{r}{a}\right)\right\} = a^2 \text{jinc}(aq)$ 

$$f(r) = \text{rect}\left(\frac{r}{a}\right)$$

$$\text{Then, } F(q) = 2\pi \int_0^{\infty} r \text{rect}\left(\frac{r}{a}\right) J_0(2\pi q r) dr$$

$$F(q) = 2\pi \int_0^{a/2} r J_0(2\pi q r) dr$$

$$2\pi q r = u$$

$$dr = \frac{du}{2\pi q}$$

$$= \frac{1}{q} \cdot \frac{1}{2\pi q} \int_0^{a\pi q} u J_0(u) du$$

$$\begin{aligned} \text{Hint} &= \frac{1}{2\pi q^2} \cdot a\pi q J_1(a\pi q) = \frac{a}{2q} J_1(a\pi q) \\ &= \frac{a^2}{2aq} J_1(a\pi q) \end{aligned}$$

$$= \boxed{a^2 \text{jinc}(aq)}$$

Q2

$$h_1(x,y) = e^{-\pi\left(\left(\frac{x}{2}\right)^2 + \left(\frac{y}{3}\right)^2\right)} \quad , \quad h_2(x,y) = \text{sinc}(4x,y)$$

Efe Eren Ceylan  
21903359

$$a) \quad MTF_1(u,v) = \frac{|H_1(u,v)|}{H_1(0,0)}$$

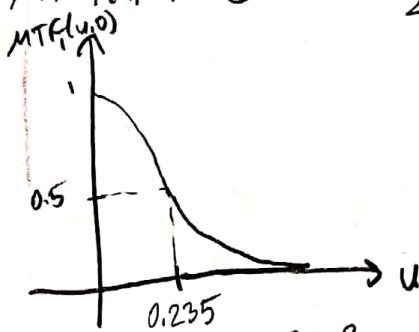

$$h_1(x,y) \xleftrightarrow{2D FT} H_1(u,v) = \frac{1}{\frac{1}{2} \cdot \frac{1}{2}} e^{-\pi((2u)^2 + (3v)^2)} = 4 e^{-\pi(4u^2 + 9v^2)}$$

$$H_1(0,0) = 4 \Rightarrow MTF_1(u,v) = \boxed{e^{-\pi(4u^2 + 9v^2)}}$$

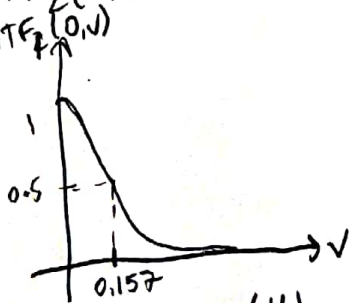

$$MTF_2(u,v) = \frac{|H_2(u,v)|}{H_2(0,0)}$$

$$h_2(x,y) \xleftrightarrow{2D FT} H_2(u,v) = \frac{1}{4} \text{rect}\left(\frac{u}{4}, v\right), \quad H_2(0,0) = \frac{1}{4} \Rightarrow MTF_2(u,v) = \boxed{\text{rect}\left(\frac{u}{4}, v\right)}$$

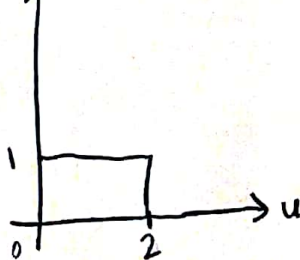

$$b) \quad MTF_1(u,0) = e^{-4\pi u^2} = \frac{1}{2} \Rightarrow u = \frac{1}{2} \sqrt{\frac{\ln 2}{\pi}} \approx 0.235$$

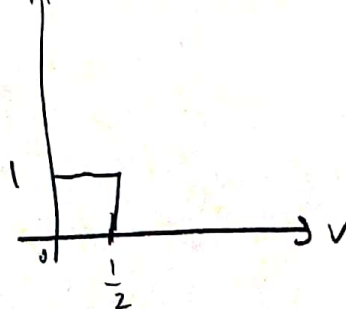

$$MTF_2(0,v) = e^{-9\pi v^2} = \frac{1}{2} \Rightarrow v = \frac{1}{3} \sqrt{\frac{\ln 2}{\pi}} \approx 0.157$$

$$MTF_2(u,0) = \text{rect}\left(\frac{u}{4}\right)$$

$$MTF_2(0,v) = \text{rect}(v)$$

$$c) f(x,y) = 3 + 2\sin(2\pi(x+y))$$

$$m_f = \frac{2}{3}$$

$$u=1, v=1$$

$$m_{g_1} = MTF_1(1,1) m_f = \frac{2e^{-13\pi}}{3} \approx 1.222 \times 10^{-18}$$

$$m_{g_2} = MTF_1(1,1) m_f = \frac{2\text{rect}(\frac{1}{4})}{3} = 0$$

Q3

$$a) e^{-\frac{\pi x^2}{4}} = \frac{1}{2} \Rightarrow x = 2\sqrt{\frac{\ln 2}{\pi}} \approx 0.833 \Rightarrow FWHM_{1x} = 1.879$$

$$e^{-\frac{\pi y^2}{9}} = \frac{1}{2} \Rightarrow y = 3\sqrt{\frac{\ln 2}{\pi}} \approx 1.409 \Rightarrow FWHM_{1y} = 2.818$$

$$\text{sinc}(4x) = \frac{1}{2} \Rightarrow \frac{\sin(4\pi x)}{4\pi x} = \frac{1}{2} \Rightarrow x \approx 0.151 \Rightarrow FWHM_{2x} = 0.302$$

$$\text{sinc}(y) = \frac{1}{2} \Rightarrow \frac{\sin(\pi y)}{\pi y} = \frac{1}{2} \Rightarrow y \approx 0.603 \Rightarrow FWHM_{2y} = 1.206$$

b) Approximation:

$$FWHM_x = \sqrt{FWHM_{1x}^2 + FWHM_{2x}^2} = 1.903$$

$$FWHM_y = \sqrt{FWHM_{1y}^2 + FWHM_{2y}^2} = 3.065$$

Q4

$\frac{\text{Dark}}{\text{Light}} > \text{Threshold} \Rightarrow \text{Diagnosis}$

Efe Eren Ceylan  
21303359

a) Threshold =  $1/10$

$$a+b+c+d = 8000$$

		Disease	
		+	-
Test	+	183 <sub>a</sub>	72 <sub>b</sub>
	-	320 <sub>c</sub>	7425 <sub>d</sub>

$$\text{Accuracy} = 0.951$$

$$\text{Prevalence} = \frac{a+c}{a+b+c+d} = \frac{503}{8000} = 0.0629$$

$$\text{Sensitivity} = \frac{a}{a+c} = \frac{183}{503} = 0.3638$$

$$\text{Specificity} = \frac{d}{b+d} = \frac{7425}{7497} = 0.9904$$

$$\text{PPV} = \frac{a}{a+b} = \frac{183}{255} = 0.7176$$

$$\text{NPV} = \frac{d}{c+d} = \frac{7425}{7745} = 0.9587$$

b) Threshold =  $1/8$

		Disease	
		+	-
Test	+	143 <sub>a</sub>	39 <sub>b</sub>
	-	360 <sub>c</sub>	7458 <sub>d</sub>

$$\text{Accuracy} = 0.950$$

$$\text{Prevalence} = \frac{a+c}{a+b+c+d} = \frac{503}{8000} = 0.0629$$

$$\text{Sensitivity} = \frac{a}{a+c} = \frac{143}{503} = 0.2843$$

$$\text{Specificity} = \frac{d}{b+d} = \frac{7458}{7497} = 0.9948$$

$$\text{PPV} = \frac{a}{a+b} = \frac{143}{182} = 0.7857$$

$$\text{NPV} = \frac{d}{c+d} = \frac{7458}{7818} = 0.9539$$

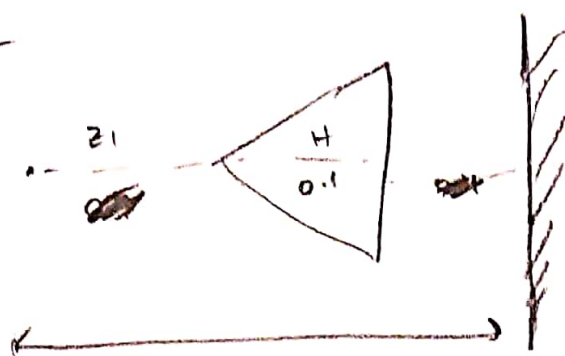

Threshold is increased. Naturally, # of positives assigned by the ANN also dropped because  $\frac{1}{10} < \frac{\text{Dark}}{\text{Light}} < \frac{1}{8}$  samples are now considered negative.

c) Second threshold is better in terms of PPV, so it is more selective when it determines (+). However, I believe that choosing a threshold depends on the application. If we were to use a test with high NPV, then we need a test with high PPV, second threshold serves a better purpose.

Q5

Efe Eren Ceylan  
21303333

$$M_0 = 0.1 \text{ cm}^{-1} = 10 \text{ m}^{-1}$$

$$H = 0.1 \text{ m}$$

$$\cos \theta = \frac{1}{\sqrt{1+x^2}}$$

P.S. This comes from:  
 $\text{rect}\left(\frac{x}{\frac{1}{5\sqrt{3}} + (z-0.6)\frac{2}{\sqrt{3}}}\right)$

a)  $z_1 = 0.5 \text{ m}$

$$\mu(x, z) = \text{rect}\left(\frac{z-0.55}{0.1}\right) \text{rect}\left(\frac{\frac{zx}{\sqrt{3}} - \frac{1}{\sqrt{3}}}{\frac{1}{5\sqrt{3}} + (z-0.6)\frac{2}{\sqrt{3}}}\right)$$

Triangular region

$$I_d(x, 0) = I_0 \cos^3 \theta e^{-\frac{1}{\cos \theta} \int_0^d \mu\left(\frac{x}{u}, z\right) dz}$$

$$= I_0 \left(\frac{1}{1+x^2}\right)^{3/2} e^{-\frac{10 \text{ m}^{-1}}{\left(\frac{1}{1+x^2}\right)^{1/2}} \int_0^1 \text{rect}\left(\frac{z-0.55}{0.1}\right) \text{rect}\left(\frac{zx}{\sqrt{3}} - \frac{1}{\sqrt{3}}\right) dz}$$

This holds, for example one can find that  $x > \frac{1}{6\sqrt{3}}$ , there is zero attenuation due to  $\mu_0$ , and for  $x = \frac{1}{6\sqrt{3}}$ , integral is equal to zero.

b)  $z_1 = 0.8 \text{ m}$

$$\mu(x, z) = \text{rect}\left(\frac{z-0.85}{0.1}\right) \text{rect}\left(\frac{\frac{zx}{\sqrt{3}} - \frac{16}{10\sqrt{3}}}{\frac{1}{5\sqrt{3}} + (z-0.6)\frac{2}{\sqrt{3}}}\right)$$

$$I_d(x, 0) = I_0 \cos^3 \theta e^{-\frac{1}{\cos \theta} \int_0^d \mu\left(\frac{x}{u}, z\right) dz}$$

$$= I_0 \left(\frac{1}{1+x^2}\right)^{3/2} e^{-\frac{10 \text{ m}^{-1}}{\left(\frac{1}{1+x^2}\right)^{1/2}} \int_0^1 \text{rect}\left(\frac{z-0.85}{0.1}\right) \text{rect}\left(\frac{zx}{\sqrt{3}} - \frac{16}{10\sqrt{3}}\right) dz}$$

Similar to the previous one,  $x > \frac{1}{5\sqrt{3}} \Rightarrow$  integral results in zero.

6)

a)

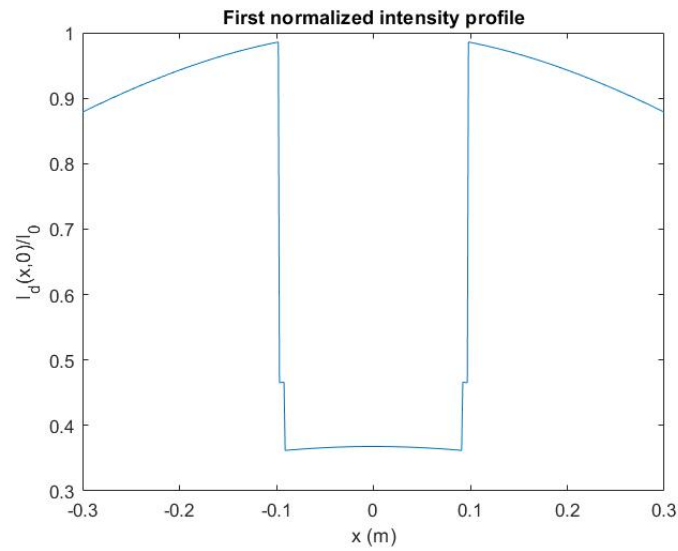

Figure 1.1

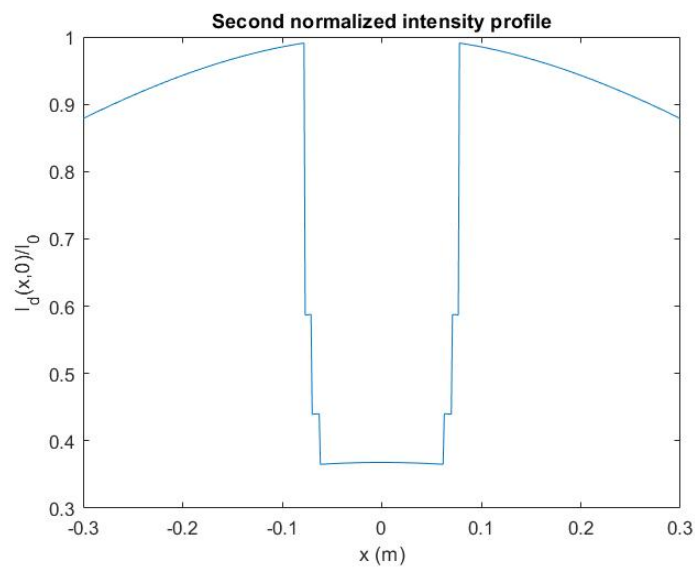

Figure 1.2

b) Geometrically speaking, in the first profile, light beam must travel with a larger angle compared to the second profile for no collision with the object. This can also be verified from the plots, since in the second profile, normalized intensity approaches to 1 before the first profile. Other than the middle part, the plots are essentially the same, since after a certain point there is no collision in both profiles.

## APPENDIX

### **MATLAB code for Q6:**

```
%% HW 2
x_val = linspace(-0.3,0.3,512);

%% empty intensities
intensity_1 = [];
intensity_2 = [];

%% generate intensities
% by the way, code runs poorly because i had some problems
while
% vectorizing it, so instead of debugging it i just used
two for loops, it
% takes max 1 mins to compile.
for i = 1:size(x_val,2)

    fun1 = @(z) rectangularPulse((z-
0.55)/0.1)*rectangularPulse(z*x_val(i)/((2*z/sqrt(3))-
(1/sqrt(3))));
    fun2 = @(z) rectangularPulse((z-
0.85)/0.1)*rectangularPulse(z*x_val(i)/((2*z/sqrt(3))-
(16/(10*sqrt(3)))));

    intensity_1(end+1) =
((1/(1+(x_val(i))^2))^(3/2)).*exp((-
10/((1/(1+(x_val(i))^2))^(1/2)))*integral(fun1,0,1));
    intensity_2(end+1) =
((1/(1+(x_val(i))^2))^(3/2)).*exp((-
10/((1/(1+(x_val(i))^2))^(1/2)))*integral(fun2,0,1));

end
